Dr Juliet Walker	Pacific Representative
Dr Reena Ramsaroop	Pathologist
Dr Glyn Thomas	Radiologist
Mr David Moss	Surgeon
Margreet Simpson	Treatment Data Collector

EXECUTIVE SUMMARY

This report presents cross-sectional data for the period January-June 2009 (6 months) and July 2007 to June 2009 (2 years), and trend data from programme inception to June 2009 for all BreastScreen Aotearoa screening and assessment indicators. Treatment indicators are located in a companion report.¹ BreastScreen Aotearoa (BSA) has offered government funded biennial mammography screening for all NZ women aged 50-64 years since 1999. In July 2004 the target age group was extended to include women aged 45-49 years and 65-69 years. Targets are provided for indicators for women aged 50-69 years. Due to the paucity of trial and screening service evidence, there is insufficient data on which to base targets for the screening of women under 50 years at present. Therefore, BSA and provider performance for the 45-49 years age group is documented throughout the report, but there are no specific recommendations. Trend data for key indicators are presented for women aged 50-64 years, however, a new times-series has also been established for the target age group of women aged 50-69 years. Some indicators in this report have 'expected' and 'desirable' targets. In the text of this Executive Summary quoted targets relate to 'expected' target values.

1. Coverage

BSA screened 107,176 women aged 45-69 years over the 6-month period from January to June 2009, of which 80,885 were aged between 50 and 69 years. For women in this age group, the biennial participation was 65.2%, which was below the target of 70%. Of biennial screens, 12.3% were initial screens and 87.7% were subsequent screens. The proportion of initial screens has declined over time, reflecting the maturing BSA programme and the increasing number of women attending for subsequent screens.

For women aged 50-69 years, significantly lower biennial participation was evident for the eligible Maori and Pacific populations (52.0% and 55.9% respectively), compared with the remaining ethnic groups (66.7%). However, biennial coverage in Maori and Pacific groups continues show a sustained increase over time.

BSSL continues to exceed the biennial coverage target of 70% reaching 79.6%, and has consistently had higher biennial coverage relative to other lead providers. BSHC also continues to exceed the biennial coverage target of 70% and for this reporting period reached 73.8%.

Re-screening proportion and timeliness

The proportion of women re-screened for the six-month period for women aged 50-69 years was 86.0% within 27 months (target >85%). Of those who attended for re-screen, 83.4% attended within 20-24 months (target >75%). The biennial re-screen rate (84.3%) for women returning for a mammogram within 27 months was also on target, with most Lead Providers meeting or exceeding the target value, with the exception of BSAL, BSM, and BSCM, with the latter two services showing a declining trend.

2. Provision of quality screening and assessment

Most targets were met for indicators relating to the provision of quality screening and assessment for each age group for the 6-month reporting period. For women 50-69 years, the two-year referral to assessment was 9.8% (target <10%) for initial screens, and 3.0% (target <5%) for subsequent screens. BSHC had a 2 year referral to assessment rate for initial screens (14.2%) that was significantly above the range of <10%.

False positives and positive predictive value

The proportion of false positives for women aged 50-69 years for the 6 month period was 8.5% for initial screens (target <9%), and 2.3% for subsequent screens (target <4%). The positive predictive value (PPV) for the programme for the 6 month reporting period was 9.8% for initial screens and 19.3% for subsequent screens, for women aged 50-69 years.

Technical recall

Technical recall rates for fixed sites for the 2-year period achieved the target of <0.5% for BSA and continue to show an improving trend overall (and for the majority of Lead Providers). Technical recall rates for mobile sites

¹ Page A, Taylor R. BreastScreen Aotearoa: Independent Monitoring Report -Treatment of women with BSA detected cancers (women screened July 2006-June 2008). BreastScreen Aotearoa: Wellington 2010.

exceeded the target value of <3% overall for BSA for the 2-year period, and showed increasing disparity between Lead Providers. The reason for high technical recalls for some Lead Providers should be investigated.

3. Early detection of DCIS or invasive breast cancer

DCIS and invasive cancer detection rate

A total of 490 cases of DCIS or invasive cancer (combined) were detected through BSA for women 50-69 years in the 6 month reporting period for initial and subsequent screens combined. The BSA cancer detection for the six-month period (DCIS and invasive combined) for women 50-69 years was 9.5 per 1,000 for initial screens and 5.7 per 1,000 women screened for subsequent screens.

The biennial cancer detection per 1,000 screens - invasive and DCIS combined - for women aged 50-69 years was 9.4 per 1,000 for initial screens and 5.6 per 1,000 for subsequent screens. This represented 1,774 cancers detected through BSA for the 2-year period. Trends in cancer detection for initial and subsequent screens have remained relatively stable across Lead Providers. Declining trends in cancer detection are evident for initial screens in BSSL (see comments under Technical Notes) and in subsequent screens for BSCtoC.

The proportion of DCIS of all cancers for women aged 50-69 over the biennium was 22.2%, ranging from 16.5% to 25.6% across Lead Providers. The proportion of DCIS of all cancers has remained relatively stable for BSA overall.

Invasive cancer detection rate

The BSA biennial invasive cancer detection for women aged 50-69 years was 7.0 per 1,000 women screened for initial screens (achieving the target of ≥ 6.1 per 1,000) and 4.2 per 1,000 for subsequent screens (achieving the target of ≥ 3.45 per 1,000). This represented 1,338 invasive cancers detected by BSA for the 2-year reporting period. The overall proportion of node negative cancers (of all invasive cancers) was 74.4% for initial screens (target >70%) and 78.1% for subsequent screens (target >75%).

Invasive cancer detected ≤ 10 mm

For women 50-69 years the overall proportion of screen detected invasive cancers ≤ 10 mm in size for the 2-year period was 28.0% for initial screens (target $\geq 25\%$) and 39.9% for subsequent screens (target $\geq 30\%$). The corresponding detection rates per 10,000 women screened for invasive cancers ≤ 10 mm were better than the target value at 19.6 for initial screens (target ≥ 15.2 per 10,000 screens) and 16.8 for subsequent screens (target ≥ 10.45 per 10,000 screens).

Invasive cancer detected <15mm

For women 50-69 years the overall proportion of screen detected invasive cancers <15mm in size for the 2-year reporting period was 41.7% for initial screens (which continues to be significantly below the target value of >50%) and 58.5% for subsequent screens (exceeding the target of >50%). The corresponding detection rates per 10,000 women screened for invasive cancers <15mm were on target at 29.3 for initial screens (target value >30.5 per 10,000 screens) and 24.6 for subsequent screens (target value >17.3 per 10,000 screens).

4. Provision of an appropriate and acceptable service

The majority of targets for indicators relating to the provision of an appropriate and acceptable service were met.

The overall proportion of women in the 6-month period who were notified of screening results within 10 working days was 97.6% for women 50-69 years, which was higher than the target value of $\geq 90\%$.

Assessment

The overall proportion of women offered a first assessment within 15 working days for the biennium for women 50-69 years was 79.4%, which was below the target value of 90%. Trend data for this indicator show stable estimates for the programme overall in the most recent period, but a continued significant decline in BSHC, and also recent declines in BSAL.

Time taken from assessment to final diagnostic biopsy

The proportion of women receiving an open biopsy within 20 working days (of those who required an open biopsy) was below the target value of 90%. The biennial proportion for this indicator for women 50-69 years was 68.8%. For

the 6-month period the overall proportion receiving an open biopsy within 20 working days was 69.0% for women 50-69 years.

The proportion of women who received their final diagnostic biopsy results within 5 working days was 86.8%, which was on target for this indicator (target value 90%). The overall proportion for the 6-month period was 87.4% for women aged 50-69 years.

5. Specific summary comments for each Lead Provider

For the following summary comments, indicators for each Lead Provider are included where targets were significantly exceeded (given most targets were achieved or exceeded across Lead Providers) and also for targets not achieved. Specifically, indicators are noted if (i) Lead Providers significantly exceeded targets for biennial indicators (i.e. exceeded the target by $\geq 10\%$ and was statistically significant) or (ii) Lead Providers were significantly below target

BreastScreen Waitemata and North (BSWN)

BSWN were either on target or exceeded targets for almost all biennial indicators for women in the target age range of 50-69 years. In particular, BSWN significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, invasive cancer detection for subsequent screens, technical recall rates at fixed sites, the percentage of rejected films at fixed and mobile sites, benign open biopsy rates in women attending for a subsequent screen, false positive rates, node negative cancers for a subsequent screen and preoperative diagnosis of cancer. Targets were not achieved for overall coverage (64.3%, target value 70%) and Maori coverage (63.0%, target value 70%), and also technical recall rates for mobile sites (4.4%, target value $< 3\%$), the percentage of women offered first assessment within 15 working days (74.6%, target 90%), the percentage of women receiving an open biopsy within 20 working days (61.1%, target 90%), and the proportion of women receiving final biopsy results within 5 working days (81.2%, target 90%).

BreastScreen Counties Manukau (BSCM)

BSCM were either on target or exceeded targets for almost all biennial indicators for women in the target age range of 50-69 years. In particular, BSCM significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, small invasive cancer detection for subsequent screens, benign open biopsy rates in women attending for a subsequent screen, false positive rates for subsequent screens, preoperative diagnosis of cancer, and technical recall rates at fixed sites and the percentage of rejected films (fixed and mobile) sites. Targets were not achieved for overall coverage (54.3%, target value 70%), Pacific coverage (52.6%, target value 70%) and Maori coverage (49.7%, target value 70%), and also the percentage of women eligible for re-screen who were re-screened within 27 months (76.8%, target 85%) - with a declining trend, and percentage of women offered first assessment within 15 working days (76.0%, target 90%).

BreastScreen Auckland Limited (BSAL)

BSAL were either on target or exceeded targets for almost all biennial indicators for women in the target age range of 50-69 years. In particular, BSAL significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, invasive cancer detection, the percentage of rejected films at fixed and mobile sites, preoperative diagnosis of cancer, and false positive rates for subsequent screens. Targets were not achieved for overall coverage (52.6%, target value 70%), Pacific coverage (57.5%, target value 70%) and Maori coverage (44.5%, target value 70%), and also the percentage of women eligible for re-screen who were re-screened within 27 months (74.8%, target 85%), technical recall rates for mobile sites (3.9%, target value $< 3\%$), and the percentage of women offered first assessment within 15 working days (73.6%, target 90%).

BreastScreen Midland (BSM)

BSM were either on target or exceeded targets for most biennial indicators for women in the target age range of 50-69 years. In particular, BSM significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, invasive cancer detection for subsequent screens, technical recall rates at fixed sites, the percentage of rejected films at fixed and mobile sites, preoperative diagnosis of cancer, and false positive rates for subsequent screens. Targets were not achieved for overall coverage (58.9%, target value 70%), Pacific coverage (50.9%, target value 70%) and Maori coverage (42.3%, target value 70%), and also the percentage of women eligible for re-screen who were re-screened within 27 months (73.6%, target 85%) - with a declining trend

and 20-24 months (60.9%, target 75%), proportion of invasive cancers <15mm (30.3, target 50%), technical recall rates for mobile sites (4.6%, target value <3%), the percentage of women receiving needle biopsy within 5 working days (81.6%, target 90%), continuing a decreasing trend from previous reporting periods, the percentage of women offered first assessment within 15 working days (81.7%, target 90%), the percentage of women receiving an open biopsy within 20 working days (41.7%, target 90%), and the proportion of women receiving final biopsy results within 5 working days (79.3%, target 90%).

BreastScreen Coast to Coast (BSCtoC)

BSCtoC were either on target or exceeded targets for almost all biennial indicators for women in the target age range of 50-69 years. In particular, BSCtoC significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, benign open biopsy rates, technical recall rates at fixed sites, the percentage of rejected films at fixed and mobile sites, false positive rates, and preoperative diagnosis of cancer. Targets were not achieved for overall coverage (65.9%, target value 70%), Pacific coverage (49.1%, target value 70%) and Maori coverage (49.0%, target value 70%), and the percentage of women receiving an open biopsy within 20 working days (27.8%, target 90%). Declining trends in cancer detection are evident for BSCtoC subsequent screens.

BreastScreen Central (BSC)

BSC were either on target or exceeded targets for almost all biennial indicators for women in the target age range of 50-69 years. In particular, BSC significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, invasive cancer detection, the percentage of rejected films at fixed and mobile sites, benign open biopsy rates in women attending for a subsequent screen, and preoperative diagnosis of cancer. Targets were not achieved for overall coverage (65.8%, target value 70%), Pacific coverage (45.7%, target value 70%) and Maori coverage (56.6%, target value 70%), technical recall rates for mobile sites (4.4%, target value <3%) and fixed sites (0.8%, target value <0.5%), and the percentage of women receiving an open biopsy within 20 working days (73.9%, target 90%).

BreastScreen South Limited (BSSL)

BSSL were either on target or exceeded targets for all biennial indicators for women in the target age range of 50-69 years. In particular, BSSL significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, invasive cancer detection for subsequent screens, benign open biopsy rates, technical recall rates at fixed and mobile sites and the percentage of rejected films for both mobile and fixed sites, false positive rates for subsequent screens, and preoperative diagnosis of cancer. Declining trends in cancer detection are evident for initial screens in BSSL (see comments under Technical Notes).

BreastScreen Health Care (BSHC)

BSHC were either on target or exceeded targets for most biennial indicators for women in the target age range of 50-69 years. In particular, BSHC significantly exceeded targets for the percentage of cancers from referral to assessment in women attending for a subsequent screen, benign open biopsy rates for women attending for a subsequent screen, the percentage of rejected films for both mobile and fixed sites, false positive rates in subsequent screens, and preoperative diagnosis of breast cancer. Targets were not achieved for Maori coverage (56.9%, target value 70%), the percentage of women eligible for re-screen who were re-screened within 20-24 months (68.7%, target 75%), technical recall rates for mobile sites (4.9%, target value <3%), and false positive rates for initial screens (13.1%, target <9%). Additional targets not achieved included the percentage of women referred to assessment for initial screens (14.2%, target <10%) continuing a marked increasing trend from previous reporting periods, the percentage of cancers from referral to assessment for initial screens (4.6%, target $\geq 9\%$), the estimated specificity (the proportion of women without breast cancer at screening who have a negative screen result) for initial screens (87.1%, target value >93%), the proportion of invasive cancers <15mm for initial screens (16.7, target 50%), and the percentage of women offered first assessment within 15 working days (34.5%, target 90%). In addition, BSHC cancer detection for both initial and subsequent screens has consistently been below the BSA total cancer detection rate, although not significantly different from the average (see comments under Technical Notes).

6. Conclusion

BSA is a population-based mammography screening programme that has participation rates across the target age group 50-69 years approaching the target of 70%, notwithstanding associated service capacity constraints related to the recent age extension into the 45-49 and 65-69 year age groups. Coverage rates lower than the target value can be

attributed to the significantly lower coverage in Maori and Pacific groups. Overall, targets for key indicators are being exceeded, or are close to being achieved. There is variation for some indicators across Lead Providers. Areas where target values were not met by BSA in the period covered in this report, and where differences between observed and expected values were of greatest magnitude, included:

- Coverage for Maori and Pacific groups (1a.7)
- Technical recall rates for mobile sites (2b.2)
- Percentage offered first assessment appointment within 15 working days (5b)
- Percentage of women having receiving an open biopsy within 20 working days (5c.2)

BSA ADVISORY GROUP COMMENTS AND RECOMMENDATIONS

1. Epidemiologists feedback on initial cancer detection data

The BSA Advisory group notes the comments on interpretation of the initial cancer detection data contained in the report (see under 'Technical Notes For Interpreting this Report').

2. Coverage

The BSA Advisory Group is pleased to note the sustained upward trend in coverage, especially for Māori and Pacific women.

However, despite increases, the overall coverage is still below the target of 70%. Disparities in coverage for Māori and Pacific women still exist.

The BSA Advisory Group recommends that Lead Providers simplify their enrolment processes and reduce multiple points of contact with women.

3. Time from Screening to First Offered Assessment

The BSA Advisory Group recommends that BreastScreen Health Care review the mechanisms available to them to improve timeliness from screening to assessment as a high priority.

4. Re-screening

Reasons for the low re-screen rates in some services require investigation.

5. Timeliness of Open Biopsy

The NSU has changed the target to 20 days, in line with the recommendation made by the BSA Surgeons UDG. This allows the target to be brought into alignment with the standard time for surgical treatment of confirmed breast cancer cases.

The BSA Advisory Group is still concerned about the failure to meet the target (90%) for the time from assessment to final biopsy.

In response to recommendations above, the BSA Advisory Group will consider Lead Provider feedback on the report template at the next meeting on 30 July 2010.

FOREWORD: BSA MONITORING PROCESS

Data are sent monthly from the eight BreastScreen Aotearoa Lead Providers (LPs) to the Information Directorate of the Ministry of Health. The data are checked by the Information Directorate, amalgamated into a single file, and sent to the National Screening Unit (NSU). The NSU runs further checks and produces performance indicator tables by Lead Provider for the preceding 6 months and preceding 2 years of the reporting period.

The tables are sent to the BSA Independent Monitoring Group (IMG) at the University of Queensland (Australia). The IMG produces an Independent Monitoring Report (IMR) including calculations of confidence intervals (CI's), time trend graphs, an analysis of data against national indicators and targets, explanatory notes and commentary. The IMG can request additional tabulations where it is felt appropriate. The IMG sends the first draft of IMR to NSU for verification and review, after which the IMR is updated.

The updated IMR draft is sent to members of the BSA Advisory Group (AG) prior to a collective meeting, where multidisciplinary and consumer context is added to comments regarding outliers. The draft report is then circulated to LPs for comment and a final version is produced. The NSU publishes the final report on the NSU website.

This BSA Independent Monitoring Report was reviewed by the BSA Advisory Group on 29 April 2010.

TECHNICAL NOTES FOR INTERPRETING THIS REPORT

Presentation of age extension data

As for previous reports, following age extension to women 45-49 years and 65-69 years, this report has aggregated the main eligible age group and presents data for women aged 50-69 years as the target age group. Data for women aged 45-49 years are presented separately. Interpreting trends in this report should take into consideration that indicators for a comparable age group are not available for periods prior to Jul-Dec, 2006. Trend data are presented for women aged 50-64 years for the programme from the first reporting period in 2001 to the June 2006, after which time-series data are broken and a new series has been established for women aged 50-69 years.

Changes to BSA Lead Providers

BreastScreen Auckland and North was split into 3 separate Lead Providers during previous reporting periods: BSAL, BSCM, BSWN. The following table provides a listing of Lead Providers clarifying these changes, and explains the absence of some data in figures showing programme trends.

Lead Provider	Abbreviation	Inception and period of programme
BreastScreen Auckland and North	BSAN	1999-June 2005
BreastScreen Auckland Limited	BSAL	July, 2005-Present
BreastScreen Counties Manukau	BSCM	October, 2005-Present
BreastScreen Waitemata and North	BSWN	February, 2006-Present
BreastScreen Midland	BSM	1999-Present
BreastScreen Coast to Coast	BSCtoC	1999-Present
BreastScreen Central	BSC	1999-Present
BreastScreen South Limited	BSSL	1999-Present
BreastScreen HealthCare	BSHC	1999-Present

Trends in programme indicators

As noted above, this report presents trend data for women aged 50-64 years from the first reporting period in 2001 to the reporting period Jan-Jan 2006. For the reporting period Jul-Dec 2006 onwards a new time series has been established for women aged 50-69 years. This time series aggregates the first biennium of data for women aged 65-69 years with women aged 50-64 years. Given the large number of indicators, and the fact that, for many indicators, large stochastic variations are evident over time (due to small underlying numbers), trend data have been presented for: (1) key programme indicators relating to participation, referral to assessment, and cancer detection; and (2) for other indicators where noteworthy trends were evident. Trend data have not been presented for women aged 45-49 years.

Population denominators

Population denominators for this report are based on smoothed estimates (by age group and ethnic group). Six-monthly population denominators are estimates based on weighted interpolation using annual population projections provided for each year. Interpolations are used to reflect population increases (or declines) in each 6-month period and result in more stable estimates for each indicator presented. This ensures that there are no artefactual increases in reported estimates due to the same annual denominator population being applied to changing 6-monthly indicator data. Population estimates for this report, and previous reporting periods (used in trend estimates), are provided in Appendix A and Appendix B.

Projected resident populations in each Lead Provider district for each year were provided by Statistics New Zealand. The projections are based on the 2001 New Zealand Census, assuming medium fertility, medium mortality, medium inter-ethnic mobility and medium migration assumptions. The denominators for each ethnic group are also taken from the Census, and are calculated from projected resident populations in each Lead Provider district, as provided

by Statistics New Zealand. In the Census it is possible to choose more than one ethnic group. Where more than one category has been chosen, priority is given to certain ethnic groups for the purposes of classification. Thus, if a woman chooses more than one category, and one of these is Maori, she is counted as Maori.

Confidence Intervals (CI's)

95% CI's have been reported for all indicators in this report. From the Central Limit Theorem, the estimate for a particular indicator - for example, invasive cancer detection rate in a 6 month period - is assumed to come from a hypothetical distribution of values for that indicator. The overall average value of this hypothetical distribution is the universal or 'true' invasive cancer detection rate for the population being studied. The 95% confidence interval indicates that there is a 1 in 20 chance that the 'true' population rate (or proportion, or mean) lies outside the range of values contained by the 95% confidence interval. Thus, the wider the 95% confidence interval, the less precise the estimate is to the true population parameter. Additionally, different statistical distributions provide more accurate and appropriate estimations of the 95% confidence intervals, and depend upon the type of indicator being studied, and the frequency of the event. For this report, 95% confidence intervals for rare events occurring in a population have been calculated using the Poisson distribution. For indicators with small numbers where proportions represent cases and non-cases the 95% confidence interval is based on the Exact Binomial distribution.

Differences between observed and target values

Both the magnitude of differences, and their statistical significance, are used to assess the relation of observed to target values.

The magnitude of the difference between the observed value and the target value is important in the interpretation of each indicator. In this report, differences of $\geq 5\%$ in magnitude that are statistically significantly different from the target value, based on 95% confidence intervals, are noted as important differences, and are indicated by '✓✓' if better than the target, or 'xx' if worse than the target. Differences of $\geq 10\%$ that are statistically significant (from the target value) are indicated by '✓✓✓' if better than the target, or 'xxx' if worse than the target. Differences of $<5\%$ in magnitude from the target value and/or differences which are not significantly different from the target value are indicated by '✓' and are considered 'on target'.

For each indicator, differences in magnitude between the observed value and the target value need to be interpreted in the context and meaning of the indicator under investigation. If the standard is 80% then a 10% difference in magnitude would contain values ranging from 72%-88%. If the standard is 10%, then a 10% difference in magnitude would contain values ranging from 9%-11%. As a guide, slight differences can be considered to be of a relative magnitude of 0-5%, moderate differences of 5-9%, and large differences $>10\%$.

Formal assessment of observed values in comparison to target values do not apply to 45-49 year old women as there is no long term trial data to indicate the achievable and optimal targets for this age group.

Target values relate only to biennial rates for women in the target age-group (50-69 years) for all indicators, and ticks and crosses for 6-month rates are not presented.

Initial cancer detection rates

As a mammographic screening program matures the proportion of visits for initial screening diminish and the proportion of subsequent visits increase. During the most recent screening period, for women 50-69 years, the proportion of initial screens are only 12% whereas the subsequent screens are 88% (see 1.a.2 below). As well as a reduction in absolute numbers with maturity (widening 95% CIs of rates), the age profile of women changes from all age groups 50-69 years at the beginning of the program, to mostly younger age groups (new entrants to the program) at maturity. Since the breast cancer incidence rate in younger women is lower than older women, the cancer detection rate from screening will decrease as the age profile of the initial screens becomes younger. The above should be borne in mind when interpreting cancer detection rates from initial screens.

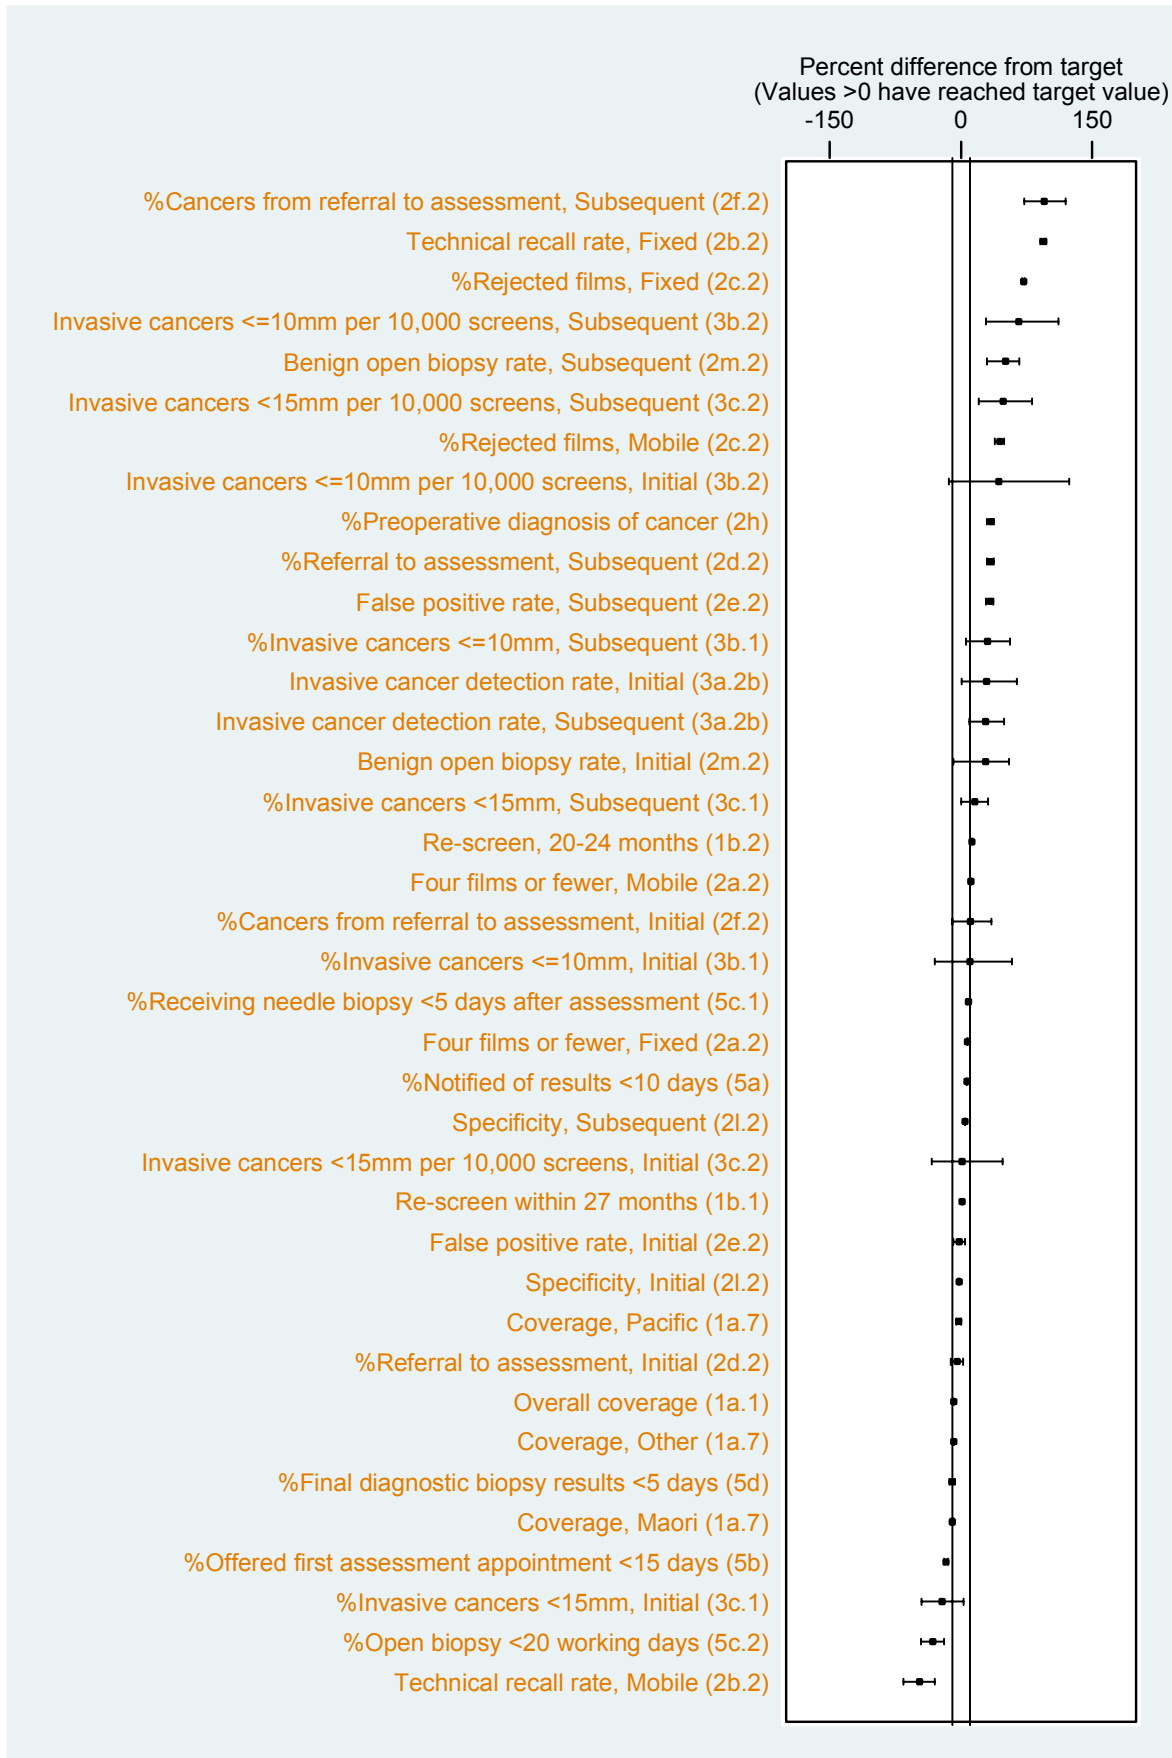

AT A GLANCE: BIENNIAL INDICATORS FOR WOMEN 50-69 YEARS

Figure 1: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSA as measured by percent difference between observed and target value (Table reference in brackets)

NB: The vertical line represent a $\pm 10\%$ difference between the observed value and the target value

Figure 2: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSWN as measured by percent difference between observed and target value (Table reference in brackets).

NB: The vertical line represent a \pm 10% difference between the observed value and the target value

Figure 3: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSCM as measured by percent difference between observed and target value (Table reference in brackets).

NB: The vertical line represent a \pm 10% difference between the observed value and the target value

Figure 4: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSAL as measured by percent difference between observed and target value (Table reference in brackets).

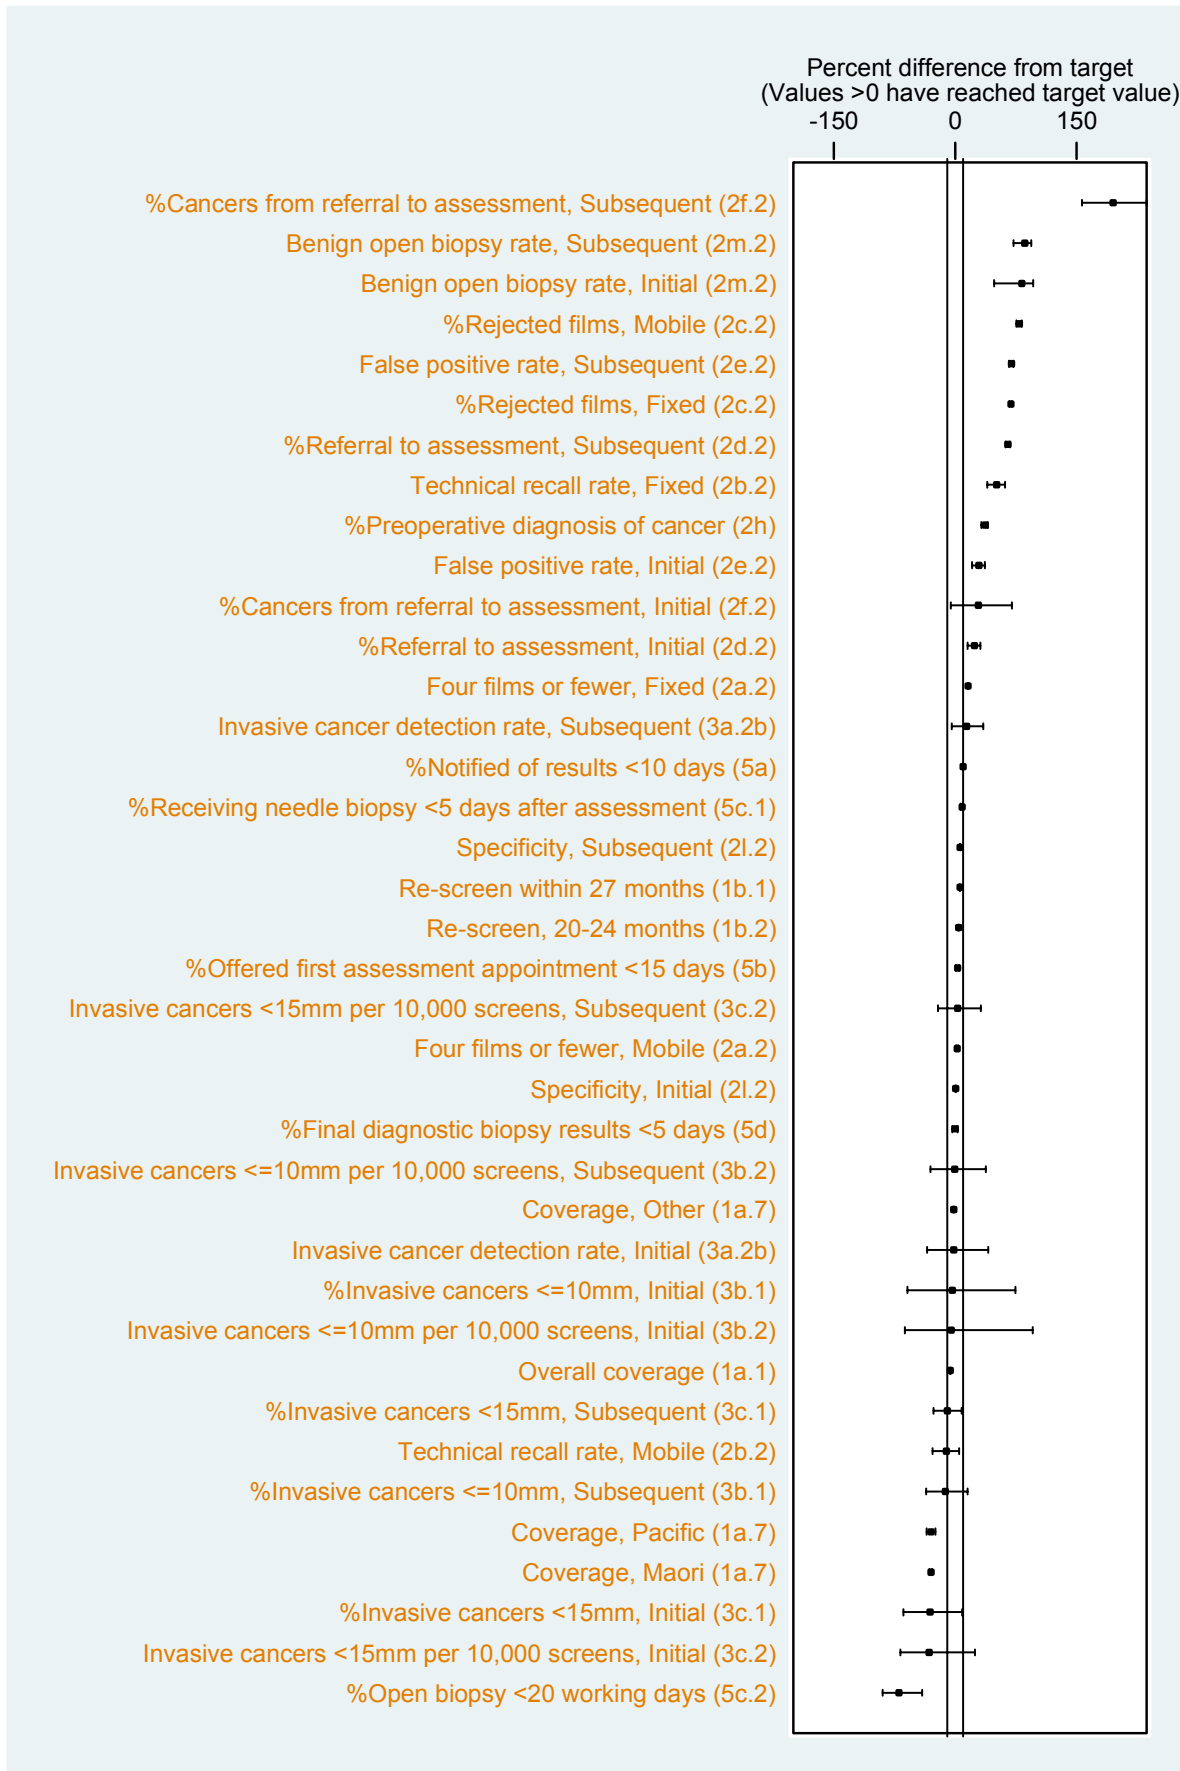

NB: The vertical line represent a \pm 10% difference between the observed value and the target value

Figure 5: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSM as measured by percent difference between observed and target value (Table reference in brackets)

NB: The vertical line represent a \pm 10% difference between the observed value and the target value

Figure 6: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSCtoC as measured by percent difference between observed and target value (Table reference in brackets)

NB: The vertical line represent a \pm 10% difference between the observed value and the target value

Figure 7: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSC as measured by percent difference between observed and target value (Table reference in brackets)

NB: The vertical line represent a $\pm 10\%$ difference between the observed value and the target value

Figure 8: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSSL as measured by percent difference between observed and target value (Table reference in brackets)

NB: The vertical line represent a $\pm 10\%$ difference between the observed value and the target value

Figure 9: Biennial indicators ‘on target’, ‘better than target’, or ‘worse than target’ for BSHC as measured by percent difference between observed and target value (Table reference in brackets)

NB: The vertical line represent a $\pm 10\%$ difference between the observed value and the target value

1. COVERAGE

1.a.1. Overall coverage of eligible women

Description: This is a population-based measure of the percentage of women in the target age group (45-49, 50-69 years) who have had a screening mammogram in the programme

Target: $\geq 70\%$ of eligible women receive a screen within the programme in the most recent 24-month period

Table 1.a.1. Overall coverage of eligible women

	6 months			2 years				
	Number of women screened	Eligible Population	% (95%CI)	Number of women screened	Eligible Population	% (95%CI)

1.b. Routine re-screening

Description: The proportion of enrolled eligible women who are re-screened, this measures the acceptability of the programme.

Target:

> 85% of women who are eligible for rescreen are re-screened, within 27 months

> 75% of women who return for a screen are re-screened between 20 to 24 months of their previous screen.

Table 1b.1: Percentage of women eligible for re-screen who are re-screened, within 27 months, 45-69 years

2.e.2. False positives as a percentage of Women screened, 2 years

Description:

Measures the proportion of women who are recalled to assessment, but after assessment are found not to have cancer (DCIS and invasive)

Target:

Initial (Prevalent) screen: expected value <9%, desired target <6%

Subsequent (Incident) screen: expected value <4%, desired target <3%

2.1. Specificity

Description:

Specificity is the proportion of women without breast cancer at screening who have a negative screen result. This is estimated by expressing the number of women who have a negative screen result as a percentage of all women screened excluding the women screened positive with cancer.

This is calculated as: number with true negative screening results as a percentage of this number plus the number with false positive screening results. (NB: Interval cancers excluded)

Target:

> 93 %

2.1.1. Specificity, 6 months

2.1.2. Specificity, 2 years

Description:

Specificity is the proportion of women without breast cancer (DCIS and invasive) at screening who have a negative screen result. This is estimated by expressing the number of women who have a negative screen result as a percentage of all women screened excluding the women screened positive with cancer.

This is calculated as: number with true negative screening results as a percentage of this number plus the number with false positive screening results. (NB: Interval cancers excluded)

Target:

> 93 %

Table 21.2: Estimated specificity of BSA by Lead Provider, 2years

3. EARLY DETECTION OF DCIS OR INVASIVE BREAST CANCER

3.a.1. DCIS and invasive cancer, 6 months

Description:

The number of women who have ductal carcinoma *in situ* and/or invasive breast cancer detected within BSA, expressed as a rate per 1000 women screened.

This is influenced by the background incidence of cancer in the population in the absence of screening. All other things being equal, the higher the cancer incidence, the higher the cancer detection rate will be.

The cancer detection targets now relate to invasive cancers only, however, total (DCIS and invasive) cancer detection rates will continue to be reported.

Table 3a.1: Detection rate of DCIS and invasive breast cancer per 1,000 women screened, 6 months

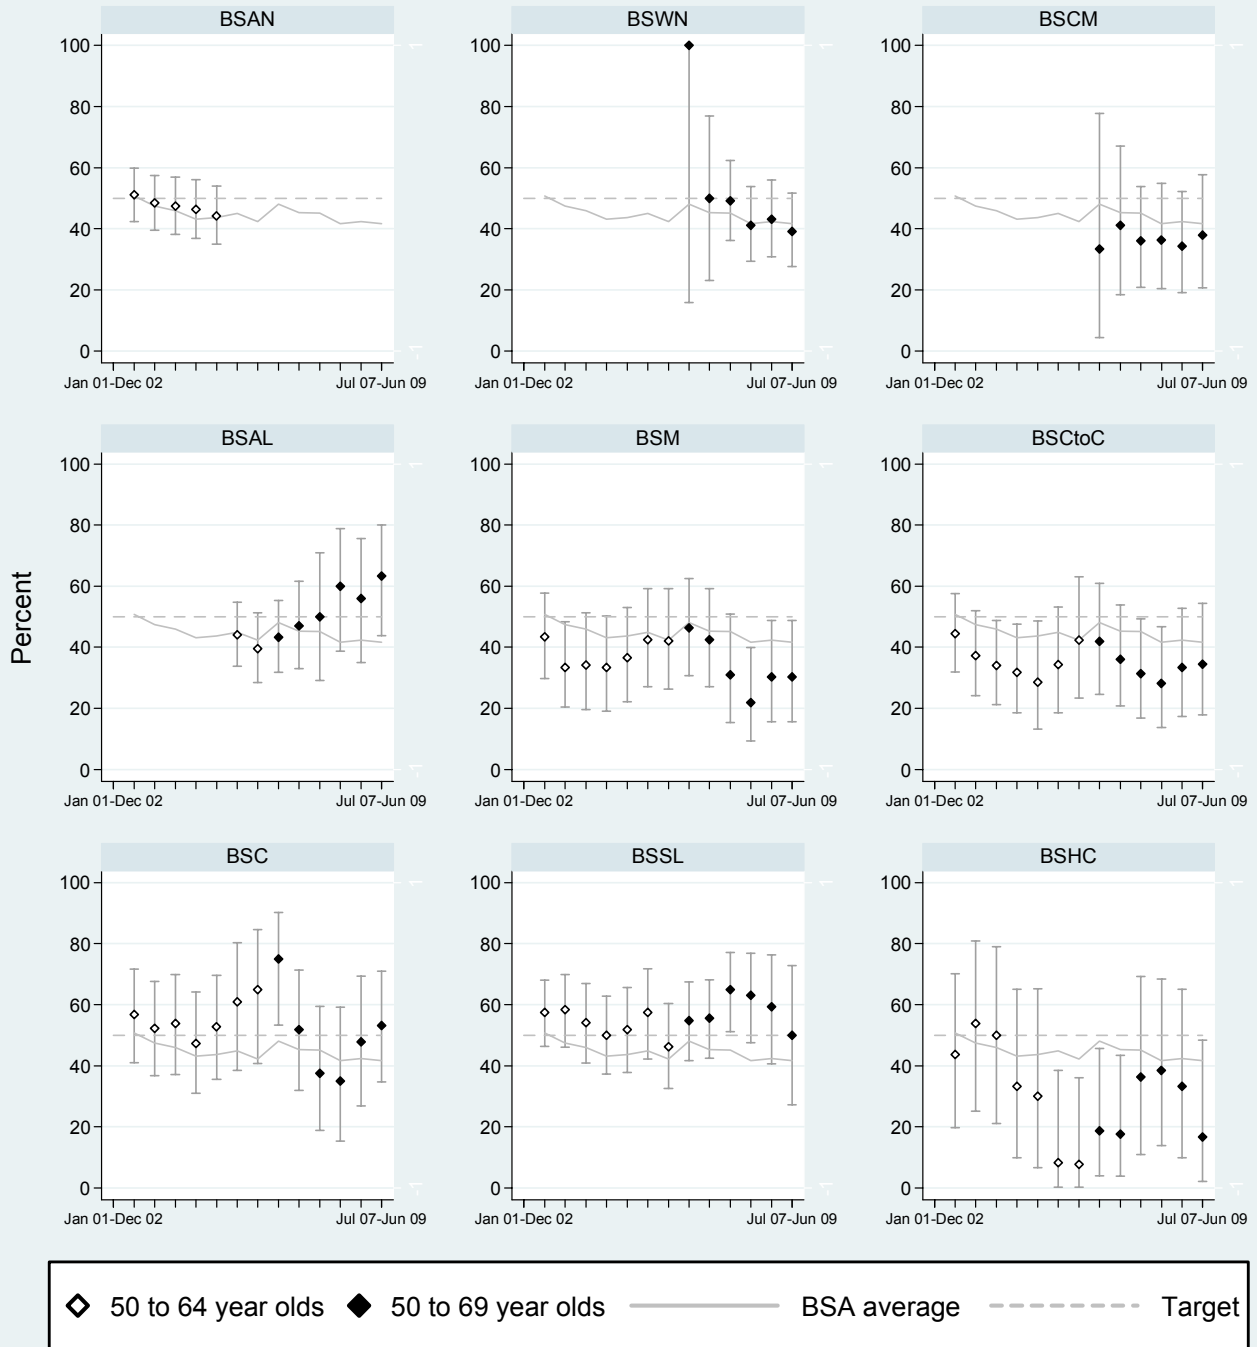

Figure 3c.1: Proportion invasive cancers <15mm, subsequent screens, 2 years

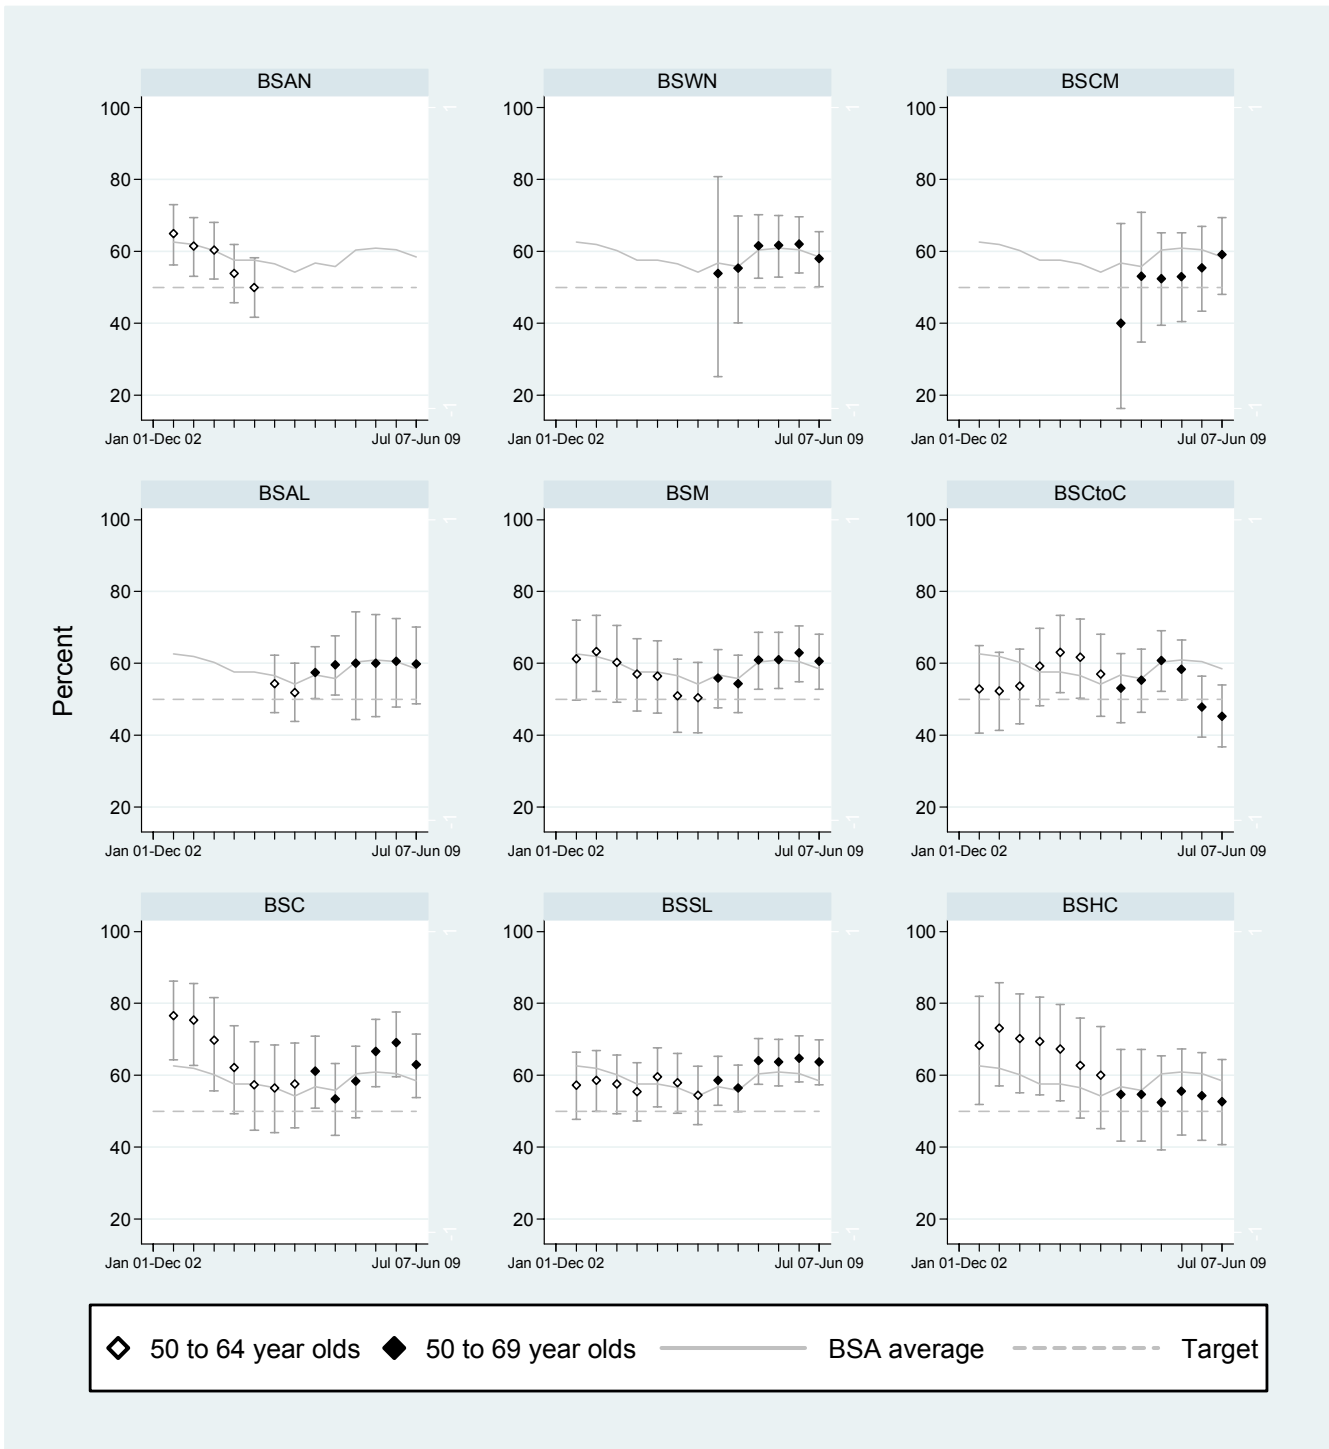

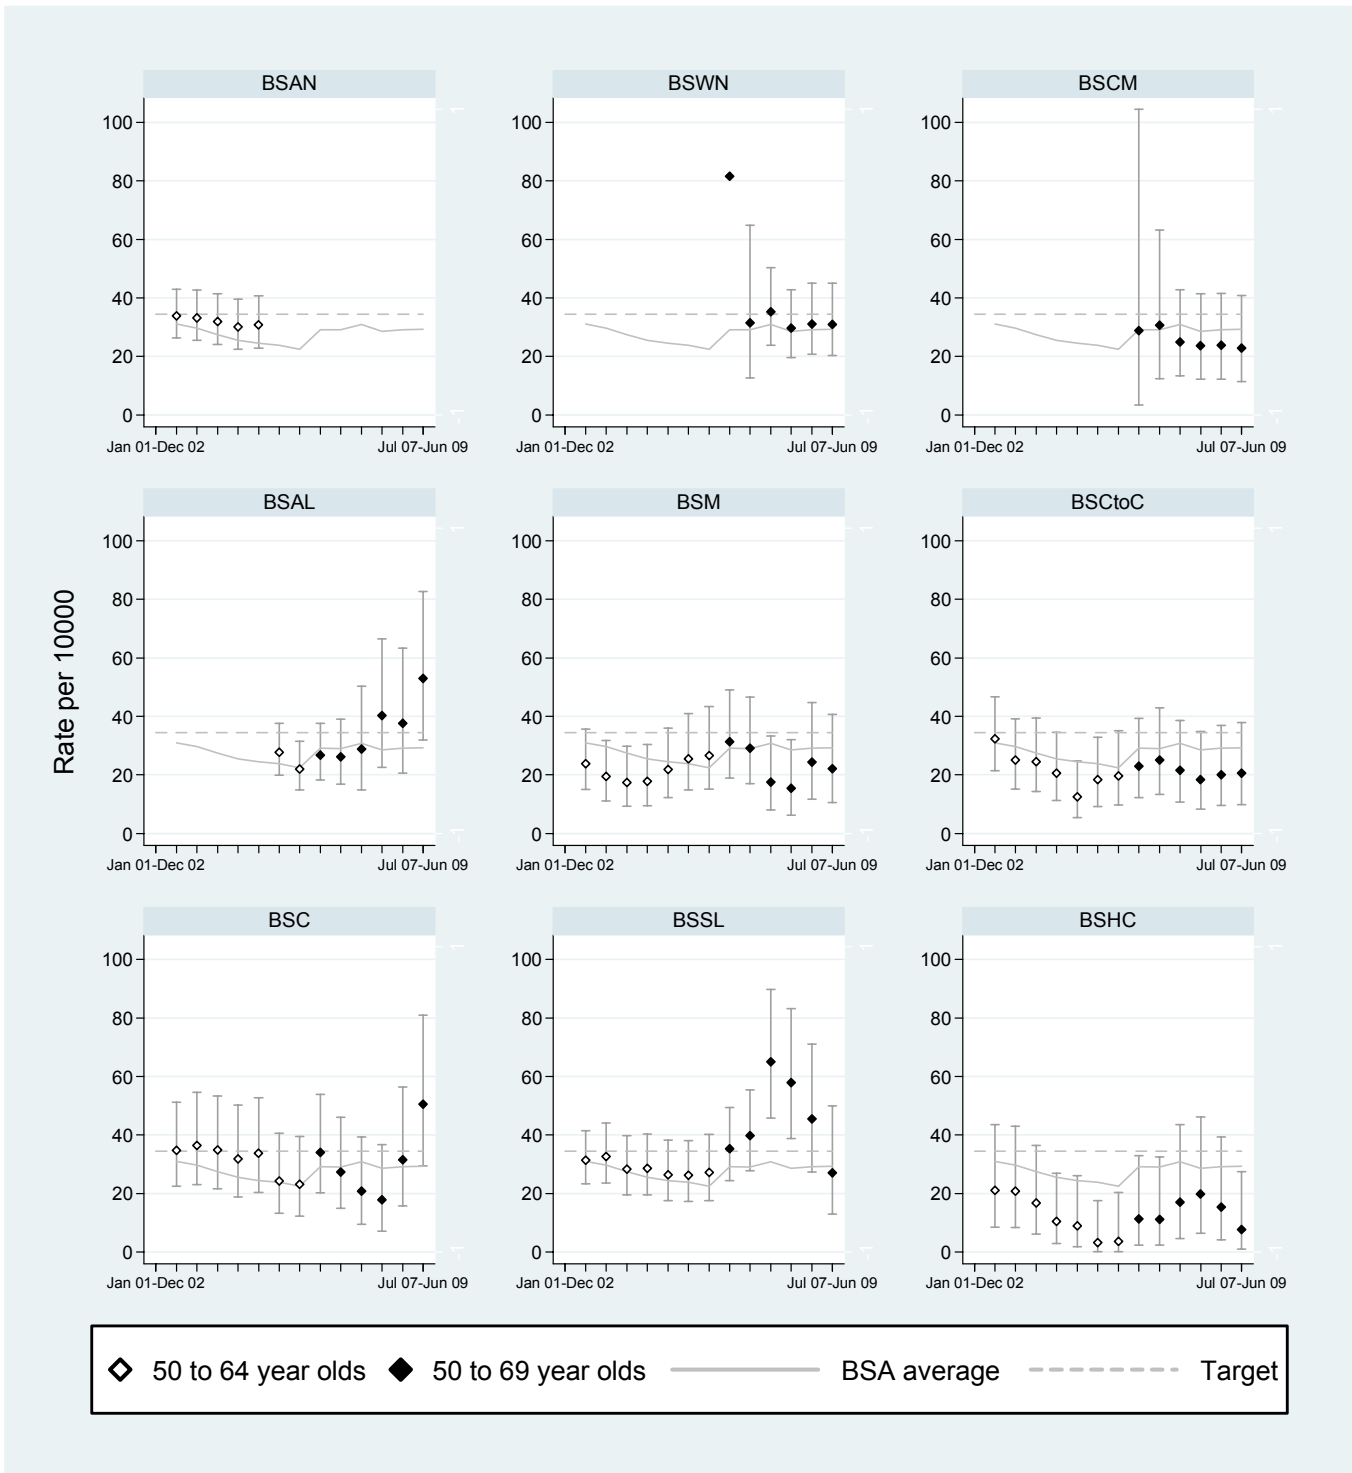

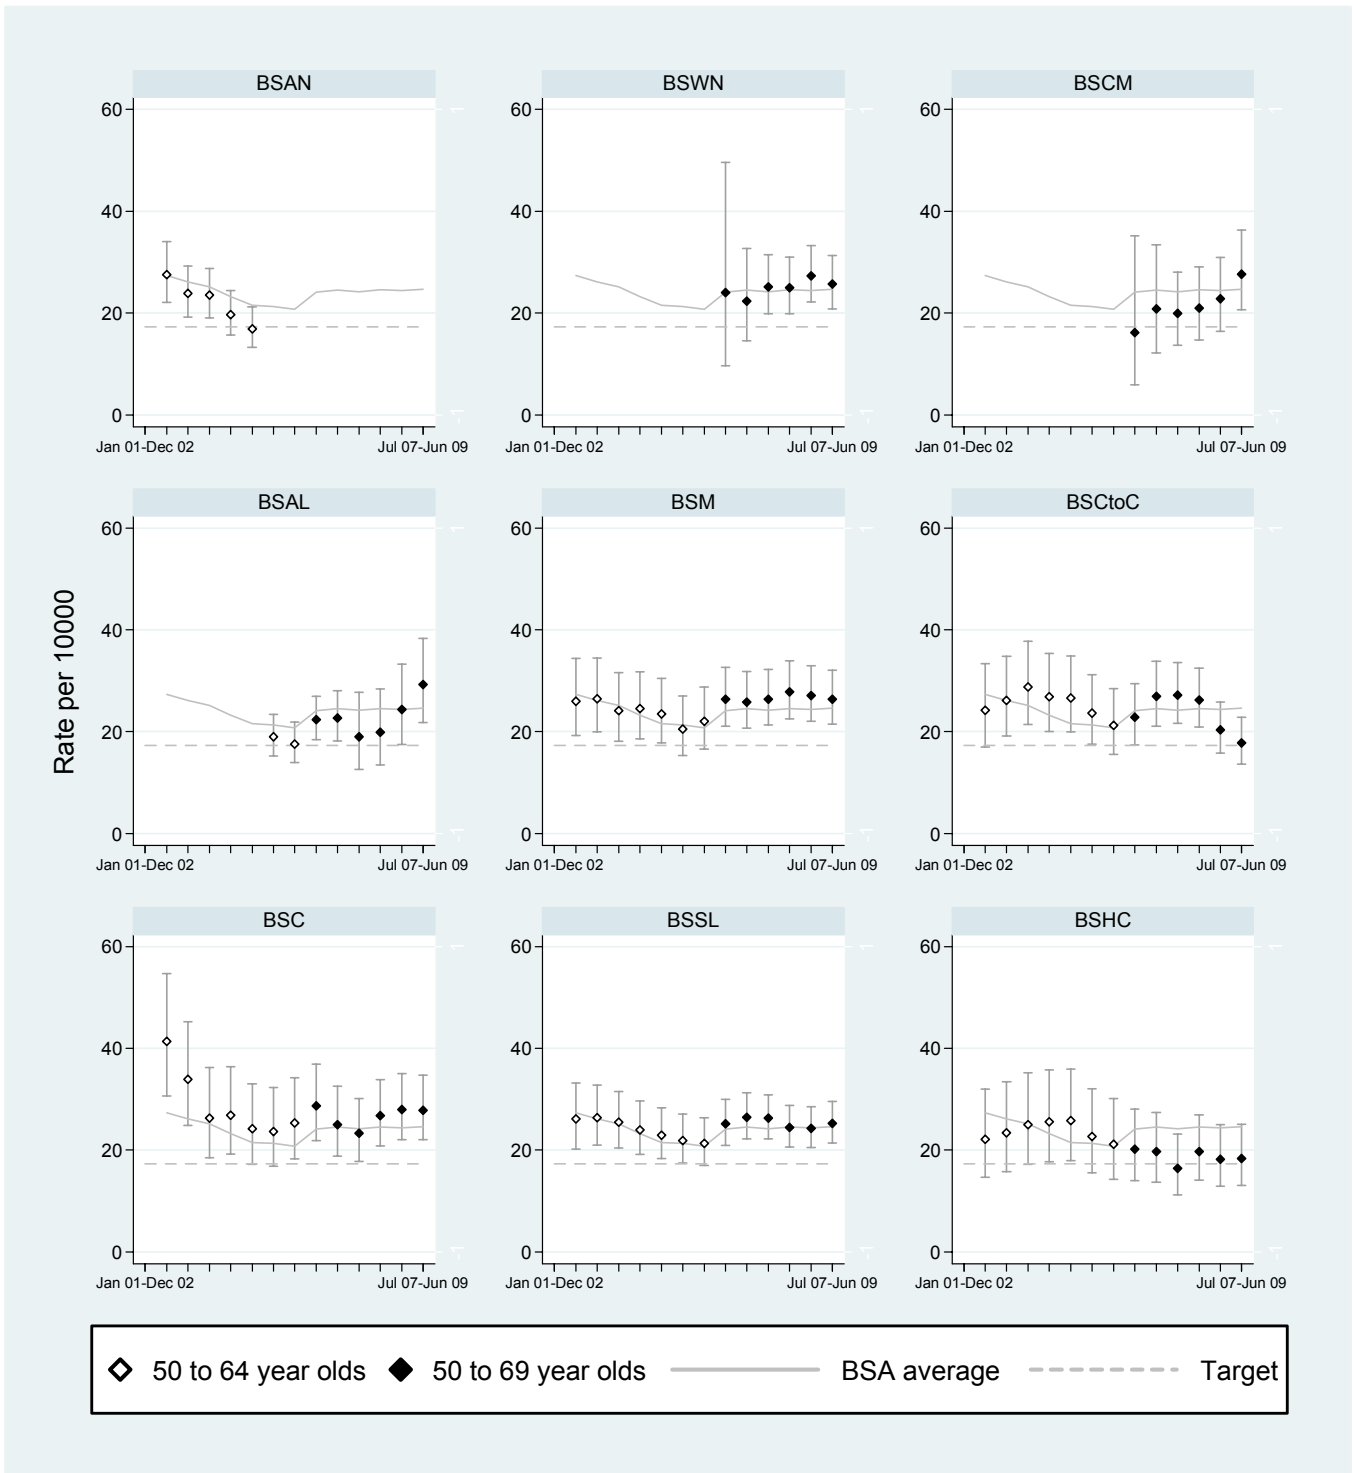

Figure 3c.2: Invasive cancers <15mm per 10,000 women screened, initial screens, 2 years

Note: 95%CI for BSWN estimate for Jan 05-Dec 06 is not shown to retain scale of 100 per 10,000 screened. Invasive cancer detection rate <15mm per 10,000 screens for BSWN is 81.6 (95%CI 9.9- 294.9).

Figure 3c.2: Invasive cancers <15mm per 10,000 women screened, subsequent screens, 2 years

3.d. Nodal involvement

Description:

The proportion of women with invasive screen detected breast cancer who do not have nodal involvement.

Note: This is calculated as 1 minus the proportion of women with invasive screen detected breast cancer who do have nodal involvement.

Target:

Initial (Prevalent) round: >70%

Subsequent (Incident) round: >75%

3.d. Proportion of node negative invasive cancers women aged 45-69 years

Table 3d: Proportion of node negative invasive cancers, 2 years

	Initial					Subsequent

xxx Difference of ≥ 10% magnitude worse than target value and statistically significant

3.e. DCIS diagnosis

Description:

The percentage of all women with screen detected cancer, who are diagnosed as having ductal carcinoma *in situ* (DCIS) as their primary lesion.

Target:

10-25% of all cancers detected by the programme are DCIS.

3.e. DCIS, women aged 45-69 years

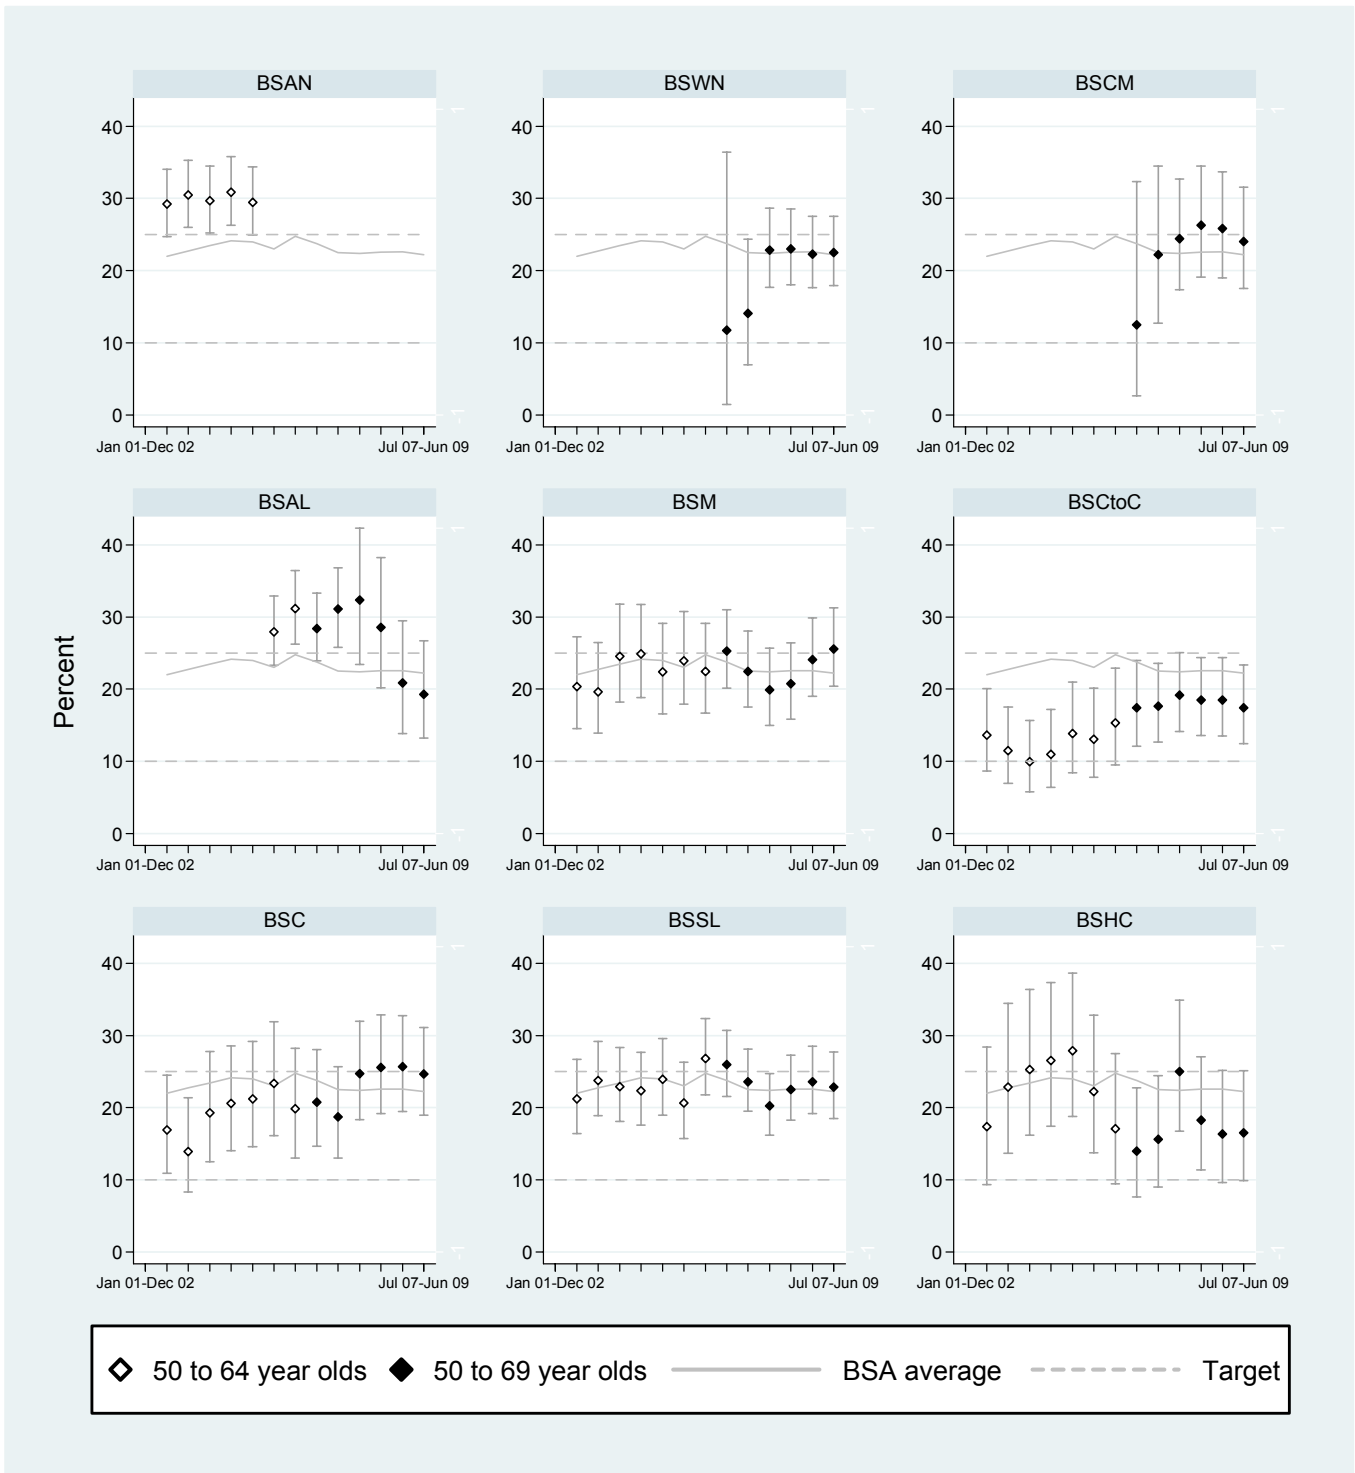

Table 3e: Women with DCIS as a percentage of all screen detected cancers, 2 years

	DCIS	Total cancers	% (95%CI)

5.c. Time taken from assessment to final diagnostic biopsy

Description:

The time between first level assessment and the final assessment procedure producing a diagnosis.

Target:

At least 90% of women requiring needle biopsy have that procedure completed within five working days of their assessment.

At least 90% of women requiring open biopsy should have this performed within 20 working days of being notified of the need for this operation.

5.c.1. Women receiving Needle Biopsy within 5 working days of assessment

Figure 5c1: Proportion of women having a needle biopsy procedure within 5 working days, 2 years

5.c.2. Women having Open Biopsy within 20 working days

At least 90% of women requiring open biopsy should have this performed within 20 working days of being notified of the need for this operation.

This indicator has been changed from ‘within 15 working days’ to ‘within 20 working days’. This change reflects the BSA Advisory Group recommendation that the NSU change the target to 20 days to be in line with the recommendation made by the BSA Surgeons UDG. This allows the target to be brought into alignment with the standard time for surgical treatment of confirmed breast cancer cases.

Table 5c.2: Proportion of women having an open biopsy procedure within 20 working days

	6 months			2 years

Exact Binomial 95% Confidence Intervals presented

* Statistically different from target value, ns Not significant

✓ On target, difference of <5% better or worse than target value based on point estimate or 95% Confidence Interval not significantly different from the target

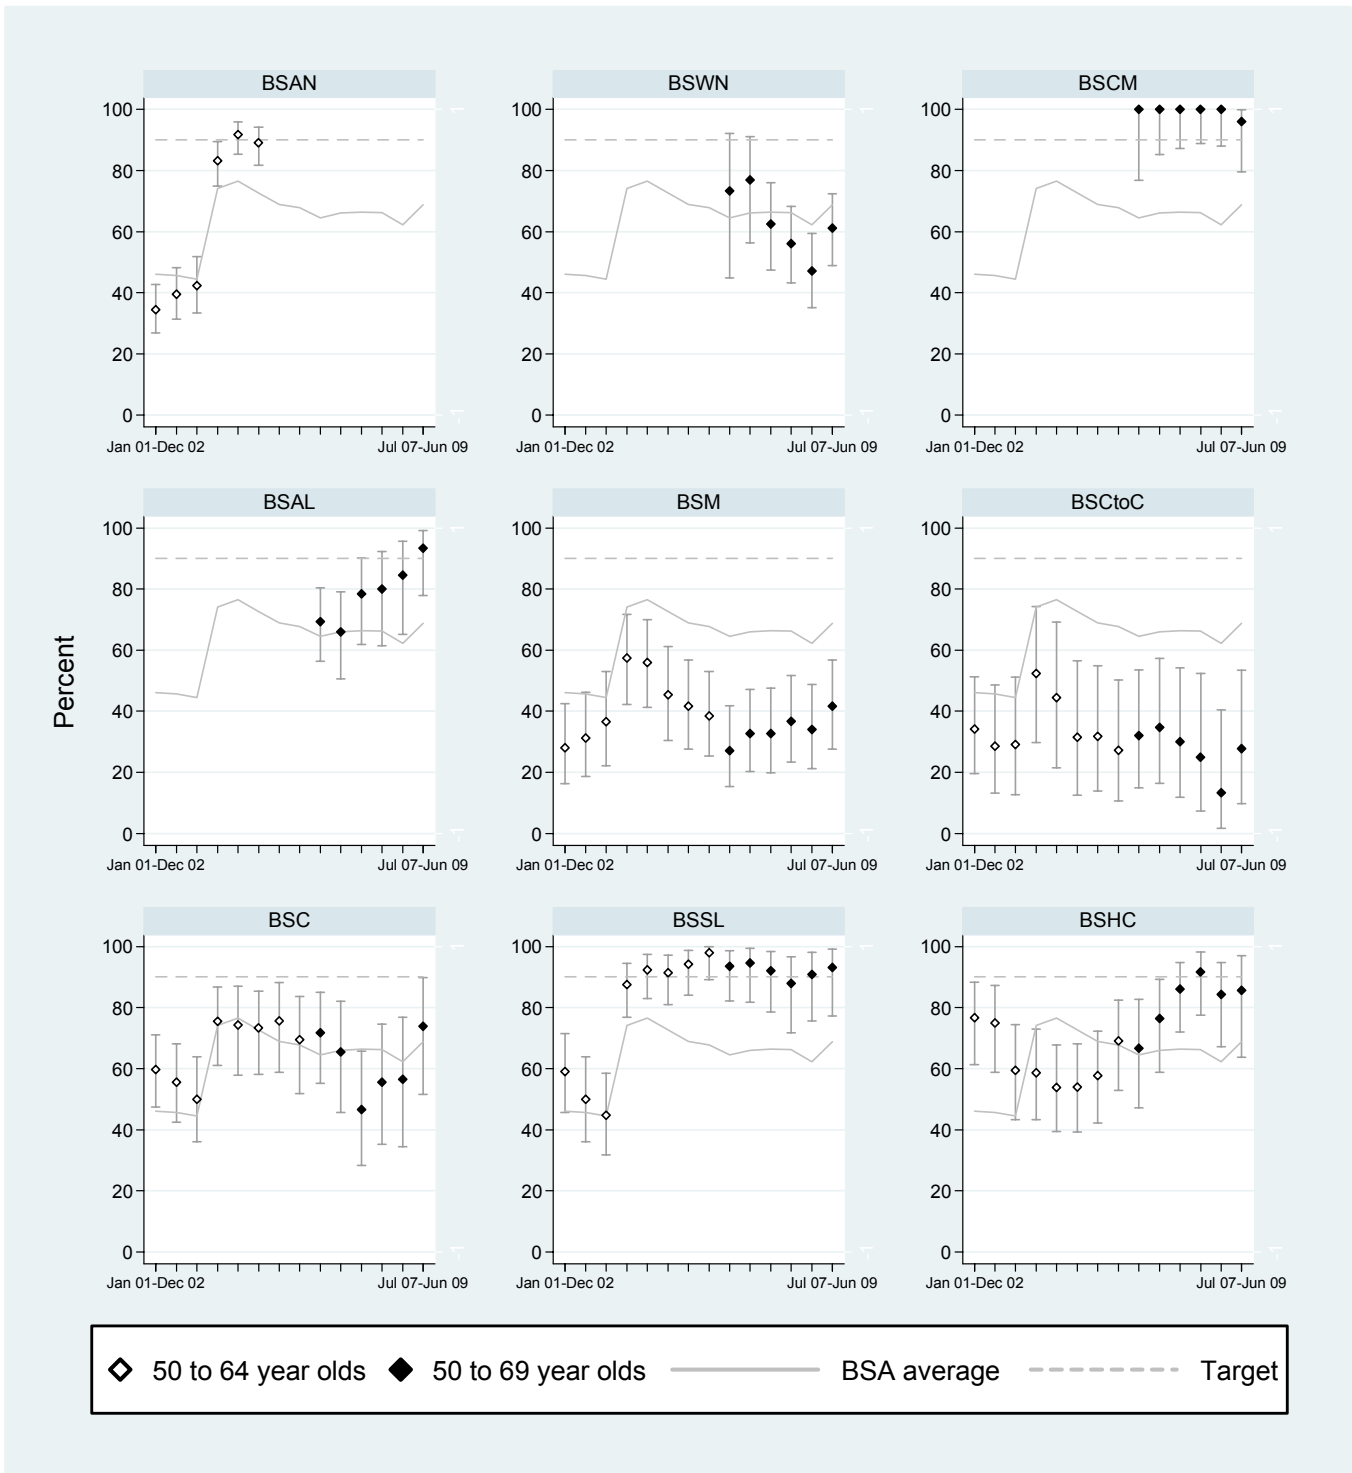

✓✓ Difference of ≥ 5-9% magnitude better than target value and statistically significant

✓✓✓ Difference of ≥ 10% magnitude better than target value and statistically significant

xx Difference of ≥ 5-9% magnitude worse than target value and statistically significant

xxx Difference of ≥ 10% magnitude worse than target value and statistically significant

APPENDIX C: GLOSSARY OF TERMS

Assessment

Follow-up investigations if something of concern is seen on a mammogram.

Assessment rate

Number of women referred to assessment as a percentage of all women screened

Asymptomatic

Women who do not have symptoms of breast cancer

Axillary dissection

A formal dissection of the axilla that removes lymph nodes for examination in the staging of breast cancer to determine if further treatment is required.

Biopsy

A sample of a breast abnormality, or the whole abnormality, is removed and examined under a microscope by a pathologist to determine whether it is cancer

Benign biopsy weight

The weight of the open biopsy specimen presented to the pathologist in instances where lesions are benign.

Benign biopsy rate

Number of open biopsies that turn out to be benign lesions, expressed as a proportion of women screened

BSA

BreastScreen Aotearoa

Coverage

Population-based measure of the percentage of women in the target age group (45-49, 50-69 years) who have had a screening mammogram in the programme

Initial screen

A woman's first screening mammogram at any BSA Lead Provider

False negative

A negative screening test result in a woman who does have cancer at the time the screening is conducted.

False positive result

The proportion of women who are recalled to assessment, but after assessment are found not to have cancer

High risk invasive breast cancer

Having at least one of the following features:

- a. pT>2cm (pathological tumour size)
- and/or
- b. Grade 2-3 (histologic and/or nuclear grade)

Lead Provider

A service provider who contracts with the National Screening Unit to provide services purchased as a result of the *Request for Proposal*. This term encompasses those individuals or organisations who act as a nominee, agent or subcontracted provider to a Lead Provider.

Positive predictive value

The proportion of women screened positive who are ultimately diagnosed as having cancer

Pre-operative diagnosis rate

Number of women in which a needle biopsy provides the definitive diagnosis (pre-operative diagnosis), as a percentage of all women diagnosed with breast cancer in the programme

Rescreen

A screening mammogram undertaken two years after the previous screen. In this report, rescreen refers to women who returned for screening within 27 months following their previous screen.

Sensitivity

The proportion of truly diseased persons in the screened population who are identified as diseased by the screening test. Sensitivity is a measure of the probability of correctly diagnosing a case, or the probability that any given case will be identified by the test.

Smoothed 6 monthly population estimates

Populations for 6 month periods are estimated by averaging populations from the preceding, current and succeeding calendar year in order to provide more accurate population denominators for 6 monthly periods (and multiples of these) for use in calculations of population rates, such as coverage.

Specificity

The proportion of women without breast cancer at screening who have a negative screen result. This is estimated by expressing the number of women who have a negative screen result as a percentage of all women screened excluding the women screened positive with cancer.

Subsequent screen

A woman's screening mammogram at a BSA Lead Provider when she has previously attended BSA.

Technical recall rate

Number of women who have to return to a screening unit (either Fixed or Mobile) for further films to complete their screening episode, expressed as a percentage of the number screened

Technical reject rate

Number of films rejected as a percentage of the number of films taken, calculated separately for women who are screened in a fixed unit and a mobile unit

APPENDIX D: Map of BSA Lead Provider Regions
